An alternative to gradient descent

Normal equation
- Only for linear regression
- Solve for w, b without iterations

Disadvantages
- Doesn't generalize to other learning algorithms.
- Slow when number of features is large (> 10,000)

What you need to know
- Normal equation method may be used in machine learning libraries that implement linear regression.
- Gradient descent is the recommended method for finding parameters w,b

Practical Tips for Linear Regression

Feature Scaling Part 1

Feature and parameter values

$\hat{price} = w_1 x_1 + w_2 x_2 + b$

size #bedrooms

x_1: size (feet^2)
range: $300 - 2{,}000$

large

x_2: # bedrooms
range: $0 - 5$

small

House: $x_1 = 2000$, $x_2 = 5$, $price = \$500\text{k}$

one training example

size of the parameters w_1, w_2?

$w_1 = 50, \quad w_2 = 0.1, \quad b = 50$

$\hat{price} = \underbrace{50 * 2000}_{100{,}000\text{k}} + \underbrace{0.1 * 5}_{0.5\text{k}} + \underbrace{50}_{50\text{k}}$

$\hat{price} = \$100{,}050.5\text{k} = \$100{,}050{,}500$

$w_1 = 0.1, \quad w_2 = 50, \quad b = 50$

small large

$\hat{price} = \underbrace{0.1 * 2000k}_{200\text{k}} + \underbrace{50 * 5}_{250\text{k}} + \underbrace{50}_{50\text{k}}$

$\hat{price} = \$500\text{k}$ more reasonable

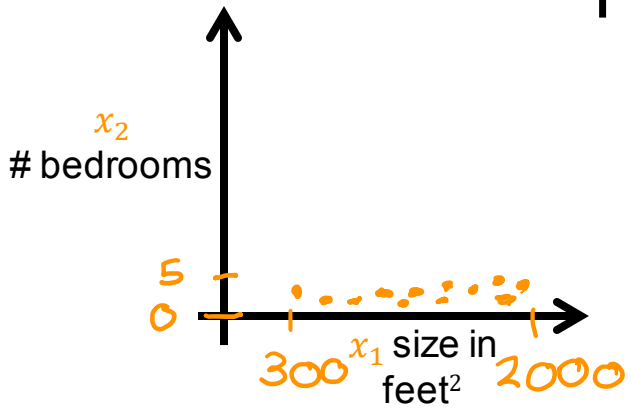
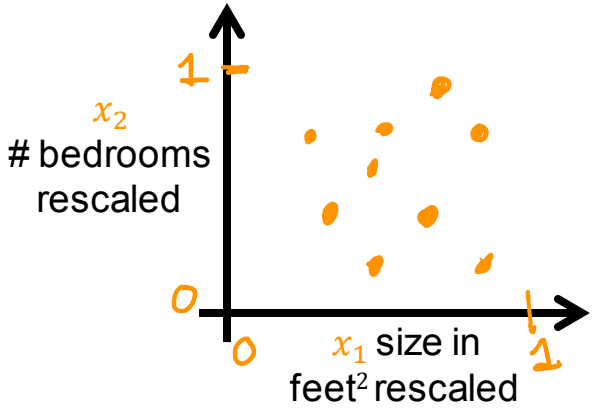
Feature Scaling Part 2

Feature scaling





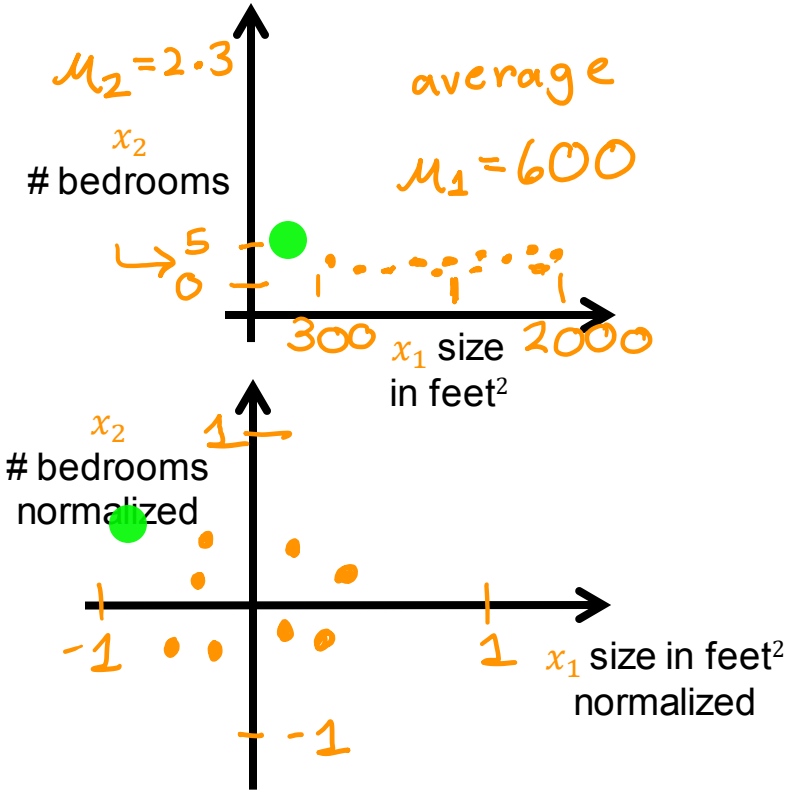
$$300 \le x_1 \le 2000 \qquad 0 \le x_2 \le 5$$

$$x_{1,scaled} = \frac{x_1}{2000} \qquad x_{2,scaled} = \frac{x_2}{5}$$

max max

$$0.15 \le x_{1,scaled} \le 1 \qquad 0 \le x_{2,scaled} \le 1$$

Mean normalization



$$300 \le x_1 \le 2000$$

$$x_1 = \frac{x_1 - \mu_1}{2000 - 300}$$

max-min

$$-0.18 \le x_1 \le 0.82$$

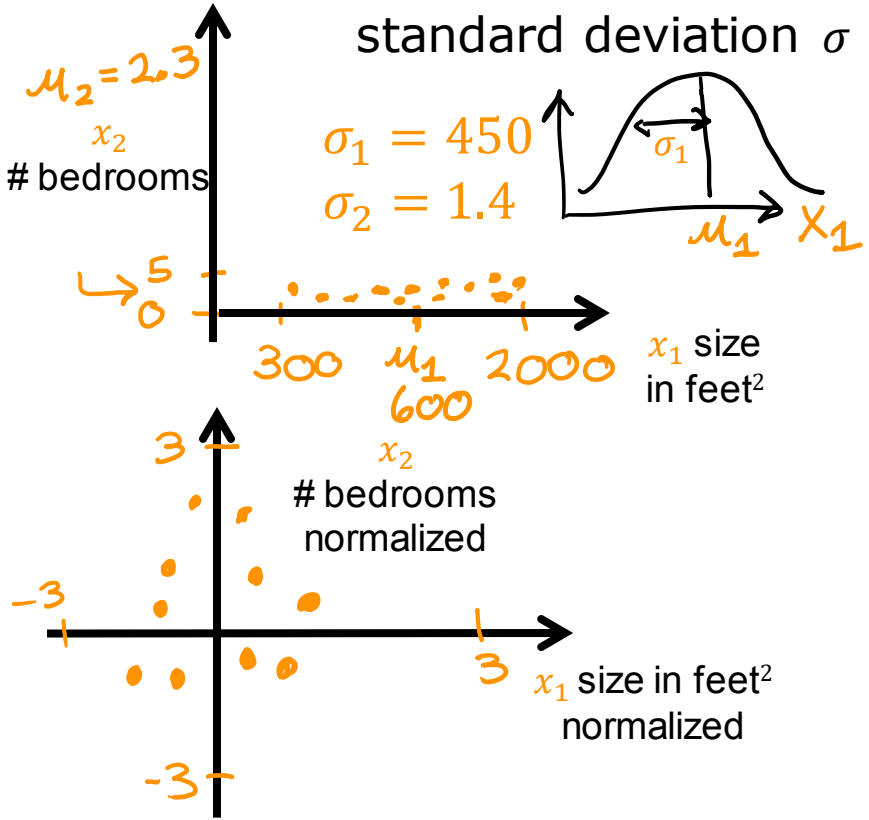
$$0 \le x_2 \le 5$$

$$x_2 = \frac{x_2 - \mu_2}{5 - 0}$$

max-min

$$-0.46 \le x_2 \le 0.54$$

Z-score normalization



$$300 \le x_1 \le 2000 \qquad 0 \le x_2 \le 5$$

$$x_1 = \frac{x_1 - \mu_1}{\sigma_1} \qquad x_2 = \frac{x_2 - \mu_2}{\sigma_2}$$

$$-0.67 \le x_1 \le 3.1 \qquad -1.6 \le x_2 \le 1.9$$

Feature scaling

aim for about $-1 \leq x_j \leq 1$ for each feature x_j

$-3 \leq x_j \leq 3$

$-0.3 \leq x_j \leq 0.3$

} acceptable ranges

$0 \leq x_1 \leq 3$ okay, no rescaling

$-2 \leq x_2 \leq 0.5$ okay, no rescaling

$-100 \leq x_3 \leq 100$ too large → rescale

$-0.001 \leq x_4 \leq 0.001$ too small → rescale

$98.6 \leq x_5 \leq 105$ too large → rescale

Checking Gradient Descent for Convergence

Gradient descent

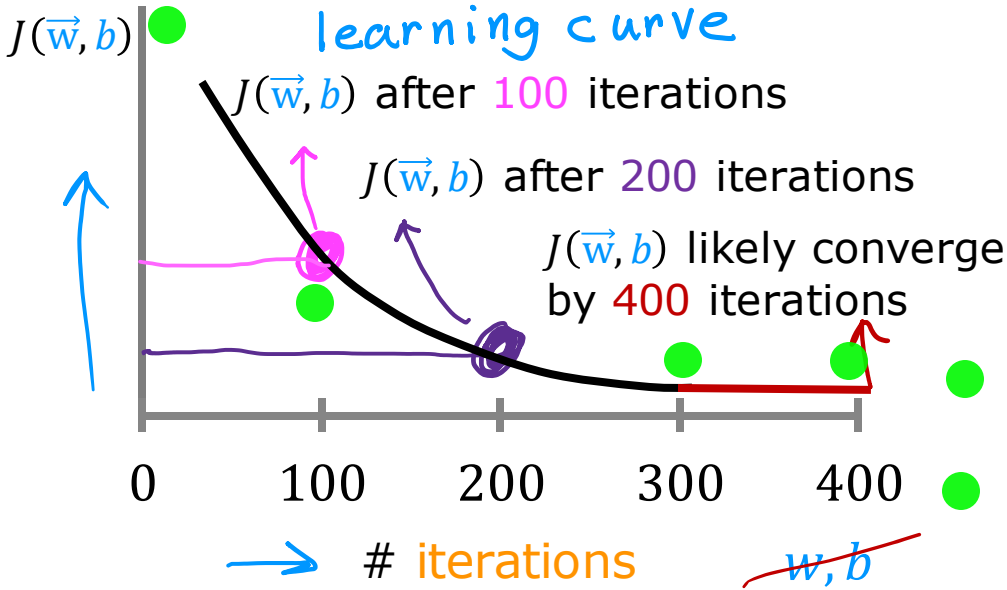
$$w_j = w_j - \alpha \frac{\partial}{\partial w_j} J(\vec{w}, b)$$

$$b = b - \alpha \frac{\partial}{\partial b} J(\vec{w}, b)$$

Make sure gradient descent is working correctly

objective: $\min_{\vec{w},b} J(\vec{w}, b)$

$J(\vec{w}, b)$ should decrease after every iteration



iterations needed varies 30 1,000 100,000

Automatic convergence test

Let ε "epsilon" be 10^{-3}. 0.001

If $J(\vec{w}, b)$ decreases by $\leq \varepsilon$ in one iteration, declare convergence.

(found parameters $\vec{w}, b$ to get close to global minimum)

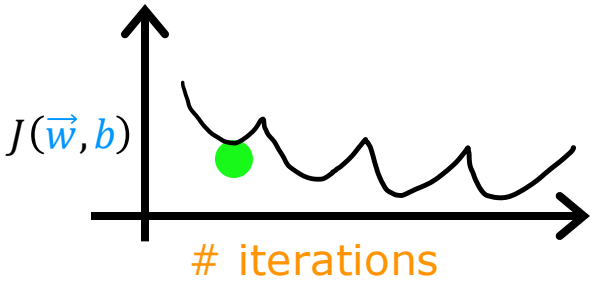
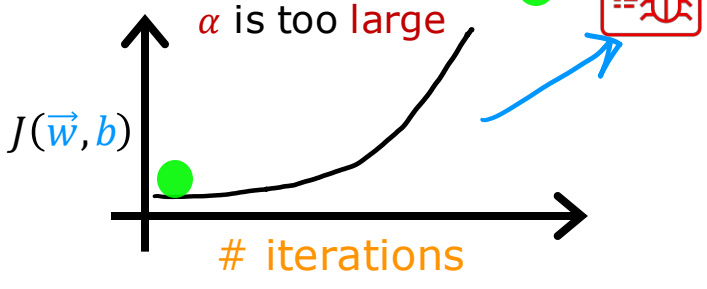
Practical Tips for Linear Regression

Choosing the Learning Rate

Identify problem with gradient descent





or learning rate is too large

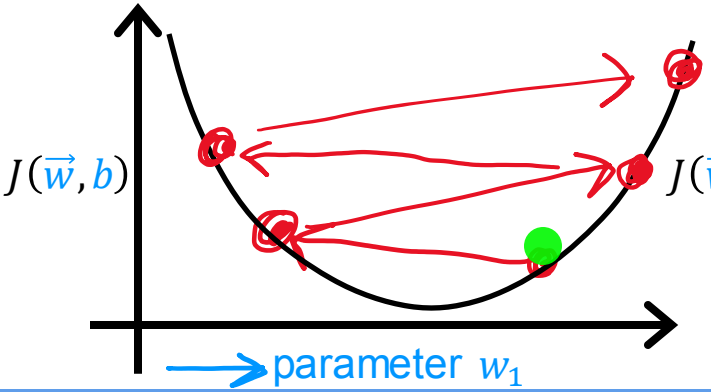
$w_1 = w_1 + \alpha d_1$

use a minus sign

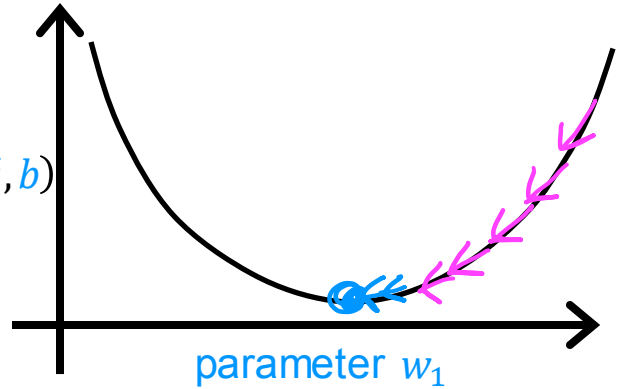
$w_1 = w_1 - \alpha d_1$

Adjust learning rate

α is too big



Use smaller α



With a small enough α, $J(\vec{w}, b)$ should decrease on every iteration

If α is too small, gradient descent takes a lot more iterations to converge

Values of α to try:

… 0.001 0.003 0.01 0.03 0.1 0.3 1 …

3x ≈3x 3x ≈3x 3x ≈3x
